Trap survey for eradicating oriental fruit flies in the Nansei Islands (Showa era)

In Japan, pests such as the arrowhead scale and the phylloxera became a major problem after the Meiji era; they had arrived from overseas, resulting in a threat to agricultural production. In 1913 (Taisho 2), the United States required plant exporting countries to issue Phytosanitary Certificates from the exporting country's government, and in 1914 (Taisho 3), the “Import and Export Plant Control Act” was enacted along with the establishment of the “Plant Inspection Office of the Ministry of Agriculture and Commerce” to begin plant quarantine.

International trade has been increasing. Distribution systems and networks such as sea containers and air-transport are expanding further, supported by relevant technological developments. Accordingly, more varieties and larger quantities of plant products have been imported into Japan. Additionally, with the increasing number of foreign tourists visiting Japan and the increase in international e-commerce mail, the risk of pest introduction is greater than ever.

Plant Protection Station focuses on various tasks to protect Japanese agriculture.
